4.1 Divisibility

 $a \mid b \leftrightarrow \exists c \text{ such that } b = ac$

Theorems

Let $a, b, c \in \mathbb{Z}$ with $a \neq 0$:

- If $a \mid b$ and $a \mid c$, then $a \mid (b + c)$
 - We also have $a \mid (mb + nc) \forall m, n \in \mathbb{Z}$
- If $a \mid b$, then $a \mid bc \ \forall c \in \mathbb{Z}$
- If $a \mid b$ and $b \mid c$, then $a \mid c$

4.2 Division Algorithm

Let $a, d \in \mathbb{Z}$ with d > 0 $\exists ! q, r \in \mathbb{Z}$ such that a = dq + r for $0 \le r < d$

Notation: If a = dq + r for $0 \le r < d$, we write:

- $q = a \operatorname{div} d$
- $r = a \mod d$

4.3 Modulo

Let $a, b, m \in \mathbb{Z}$ with $m \ge 2$. a is congruent to b modulo m if $m \mid (a - b)$, and we denote it as $a \equiv b \pmod{m}$

Note: $a \equiv b \pmod{m} \leftrightarrow b \equiv a \pmod{m}$

Theorems

- Let $a, b, c, d, m \in \mathbb{Z}$ with $m \ge 2$. If $a \equiv b \pmod{m}$ and $c \equiv d \pmod{m}$, then:
 - $a + c \equiv b + d \pmod{m}$
 - $ac \equiv bd \pmod{m}$
- $a + c \equiv b + c \pmod{m} \rightarrow a \equiv b \pmod{m}$
- $c \not\equiv 0 \pmod{m}$, $ac \equiv bc \pmod{m} \not\rightarrow a$ $\equiv b \pmod{m}$

4.4 Arithmetic Modulo

For $m \ge 2$, define $\mathbb{Z}_m = \{0,1,2,...,m-1\}$ $a +_m b = (a + b) \pmod{m}$ $a \cdot_m b = (a \cdot b) \pmod{m}$

5.1 Prime Numbers

 $p \in \mathbb{Z}$ is prime if it has exactly two divisors, 1 and itself

Fundamental Theorem of Arithmetic

All integers greater than 1 can be written as a unique product of prime numbers

Theorems

- For $n \in \mathbb{Z}$ such that n > 1. If n is not prime, then n has a prime divisor p such that $p \leq \sqrt{n}$
- There exists an infinite number of prime numbers

Greatest Common Divisor

For $a, b \in \mathbb{Z}$ such that $a \neq 0$ or $b \neq 0$

The greatest integer d such that $d \mid a$ and $d \mid b$ is the GCD of a and b

a, b are coprime if GCD(a, b) = 1

5.4 Least Common Divisor

For $a, b \in \mathbb{Z}$ such that $a \neq 0$ and $b \neq 0$

The least integer m such that $a \mid m$ and $b \mid m$ is the LCM of a and b

Theorems

- lacksquare For $n=p_1^{a_1}p_2^{a_2}\dots p_k^{a_k}$ where p_i are prime numbers and $a_i > 0$ are integers and for $d \in \mathbb{Z}$ Then $d \mid n \leftrightarrow d = p_1^{b_1} p_2^{b_2} \dots p_k^{b_k}$ where $0 \le b_i \le a_i$
- For $\begin{cases} a = p_1^{a_1} \dots p_k^{a_k} \\ b = p_1^{b_1} \dots p_k^{b_k} \end{cases}$ with p_i primes and $a_i, b_i \ge 0$:

 - GCD $(a,b) = p_1^{\min(a_1,b_1)} \dots p_k^{\min(a_k,b_k)}$ LCM $(a,b) = p_1^{\max(a_1,b_1)} \dots p_k^{\max(a_k,b_k)}$
- \blacktriangleright GCD $(a,b) \times$ LCM $(a,b) = a \times b$
- For $a, b, q, r \in \mathbb{Z}$ such that a = bq + r, then GCD(a, b) = GCD(b, r)

6.1 Euclid's Algorithm

 $a = q_1 \times b + r_1$ $b = q_2 \times r_1 + r_2$ $r_1 = q_3 \times r_2 + r_3$ $r_{n-2} = q_n r_{n-1} + r_n$ $r_{n-1} = q_{n+1}r_n + r_{n+1}$ And $GCD(a, b) = r_n$ when $r_{n+1} = 0$

6.2 Bezout's Algorithm

For $a, b \in \mathbb{Z}$ and a, b > 0, then there exists $s, t \in \mathbb{Z}$ such that sa + tb = GCD(a, b)

We run Euclid's algorithm backwards:

 $GCD(a, b) = r_n = r_{n-2} - q_{n-1} \times r_{n-2} = \dots = sa + tb$

Example of Euclid and Bezout

Run Euclid first for GCD(662,414)

$$a: 662 = 1 \times 414 + 248$$

$$b: 414 = 1 \times 248 + 166$$

$$c: 248 = 1 \times 166 + 82$$

$$d: 166 = 2 \times 82 + 2$$

$$e: 82 = 41 \times 2 + 0$$

So
$$GCD(662, 414) = 2$$

Run Bezout now:

$$2 = 166 - 2 \times 82$$
 from *d*

$$= 166 - 2(248 - 1 \times 166)$$
 from c

$$= -2 \times 248 + 3 \times 166$$
 simple rearranging

$$= -2 \times 248 + 3(414 - 1 \times 248)$$
 from b

$$= 3 \times 414 - 5 \times 248$$
 simple rearranging

$$= 3 \times 414 - 5(662 - 1 \times 414)$$
 from a

$$= 8 \times 414 - 5 \times 662$$
 simple rearranging

$$= -5 \times 662 + 8 \times 414$$

$$So -5 \times 662 + 8 \times 414 = 2 = GCD(662, 414)$$

Theorems

- If GCD(a, b) = 1 and $a \mid (bc)$, then $a \mid c$
- $\exists s, t \in \mathbb{Z}$ such that $sa + tb = m \leftrightarrow GCD(a, b) \mid m$
- For $m \ge 2$: If $ac \equiv bc \pmod{m}$, GCD(c, m) = 1, then $a \equiv b \pmod{m}$
- For p, a prime number and $a_1, ..., a_n \in \mathbb{Z}$ If $p \mid (a_1 \times \cdots \times a_n)$, then $\exists 1 \le i \le n$ s.t $p \mid a_i$
- For $m \ge 2$ and $a \in \mathbb{Z}_m$ The unique multiplicative inverse of $a \pmod{m}$ exists if and only if GCD(a, m) = 1

9 Chinese Remainder Theorem

Let $m_1, m_2, ..., m_r \in \mathbb{Z}$ be pairwise co-prime integers such that $m_i \ge 2 \ (1 \le i \le r)$

Let a_1 , a_2 , ... , $a_r \in \mathbb{Z}$, then the system:

$$x \equiv a_1 \pmod{m_1}$$

$$r = a$$
 (m

$$x \equiv a_r \pmod{m_r}$$

admits a unique solution

Fermat's Little Theorem

Let $p, a \in \mathbb{Z}$ such that p is prime. Then:

- $a^p \equiv a \pmod{p}$
- If gcd(a, p) = 1, then $a^{p-1} \equiv 1 \pmod{p}$

Theorems

Let $p, q, M \in \mathbb{Z}$ such that p, q are two different primes, and gcd(M, pq) = 1, then: $M^{(p-1)(q-1)} \equiv 1 \pmod{pq}$

13 Asymptomatic Notation

Let f, g be functions $N \to \mathbb{R}^+$ and let $c \in \mathbb{R}^+$ and $k \in \mathbb{N}$:

- ▶ Big *O*-Notation: Asymptotic Upper Bound f = O(g) if $\exists c, k$ such that $f(n) \le c \cdot g(n) \ \forall n \ge k$
- \blacktriangleright Big Ω-Notation: Asymptotic Lower Bound $f = \Omega(g)$ if $\exists c, k$ such that $f(n) \ge c \cdot g(n) \ \forall \ n \ge k$
- ▶ Big Θ-Notation: Asymptotic Tight Bound $f = \Theta(g)$ if f = O(g) and $f = \Omega(g)$

Theorems

- For $a, b \in \mathbb{R}$ s. t a, b > 0. We have $\log^a(x) = O(x^b)$
- $f(n) = O(g(n)) \leftrightarrow g(n) = \Omega(f(n))$
- $f(n) = \Theta(g(n)) \leftrightarrow g(n) = \Theta(f(n))$

14.1 Recursivity

Example: Fibonacci Sequence

$$F_0=0$$

$$F_1 = 1$$

$$\overline{F_n} = F_{n-1} + F_{n-2} \quad (n \ge 2)$$

14.2 Characteristic Equation and Roots

Characteristic equation for a recursive function:

$$r^k - c_1 r^{k-1} - c_2 r^{k-2} - \dots - c_k = 0$$

The solutions are called the *characteristic roots*.

Example: Fibonacci Sequence

Characteristic Equation:
$$r^2 - 1r^1 - 1 = 0$$

$$\rightarrow r^2 - r^1 - 1 = 0$$

Using the quadratic formula, we get

$$r = 1 \pm \frac{\sqrt{(-1)^2 - 4(1)(-1)}}{2(1)} = \frac{1 \pm \sqrt{5}}{2}$$

$$r = 1 \pm \frac{\sqrt{(-1)^2 - 4(1)(-1)}}{2(1)} = \frac{1 \pm \sqrt{5}}{2}$$

So $F_n = \alpha \left(\frac{1 + \sqrt{5}}{2}\right)^n + \beta \left(\frac{1 - \sqrt{5}}{2}\right)^n$

is a solution for any $\alpha, \beta \in$

Now we must find α , β such that the formula matches the base cases

$$F_0 = \alpha \left(\frac{1+\sqrt{5}}{2}\right)^0 + \beta \left(\frac{1-\sqrt{5}}{2}\right)^0 = 0$$

$$F_1 = \alpha \left(\frac{1+\sqrt{5}}{2}\right)^1 + \beta \left(\frac{1-\sqrt{5}}{2}\right)^1 = 1$$

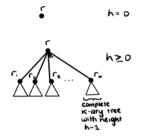

After solving, we get $\alpha = \frac{1}{\sqrt{5}}$ and $\beta = -\frac{1}{\sqrt{5}}$

Theorems

• (Lamé) Let $a, b \in \mathbb{Z}$ such that $a \ge b > 0$ Euclid's algorithm takes $O(\log(b))$ steps

K-ary Trees

A complete k-ary tree with *height h* and *root r* is defined recursively as follows:

Recursive Definition for size: n(h) $= \begin{cases} 1 \text{ if } h = 0\\ k \cdot n(h-1) + 1 \text{ otherwise} \end{cases}$

Function Definition: $n(h) = \frac{k^{n+1} - 1}{k - 1}$

Recursive Algorithms

Example: Number of strictly positives NB(A[1, ..., n])

If
$$n = 1$$
: Base Case for size $n = 1$
If $A[1] > 0$: Return 1
Else: Return 0

Else:

$$m=\left\lfloor \frac{n}{2} \right\rfloor$$
 Split into 2 subproblems $a_1=NB(A[1,\ldots,m])$ Recursive Call $a_2=NB(A[m+1,\ldots,n])$ Recursive Call Return $a=a_1+a_2$ Combining Step

Number of
$$T(1) = 3$$
, $(n = 1)$
step in NB $T(n) = 2 \times T(\frac{n}{2}) + 4$, $(n > 1)$

- 2 is the number of recursive calls $T\left(\frac{n}{2}\right)$ is the size of the recusive step
- 4 is the merge step + extra work

17 Unfolding

Example:
$$T(n) = \begin{cases} 3, & n = 1 \\ 2T(\frac{n}{2}) + 4, & n \ge 2 \end{cases}$$

Assume $n = 2^k$ for some $k \in \mathbb{N}$, since n has to be divisible by 2

$$T(n) = 2T\left(\frac{n}{2}\right) + 4 = 2\left(2T\left(\frac{n}{2}\right) + 4\right) + 4$$

$$= 2^{2} \times T\left(\frac{n}{2^{2}}\right) + 2(4) + 4$$

$$= 2^{2}\left(2T\left(\frac{n}{2^{2}}\right) + 2(4)\right) + 2(4) + 4$$

$$= 2^{3} \times T\left(\frac{n}{2^{3}}\right) + 4(4) + 2(4) + 4$$

$$\vdots$$

$$= 2^{k}T\left(\frac{n}{2^{k}}\right) + \left(\sum_{i=0}^{k-1} 2^{i}\right)(4) = nT\left(\frac{2^{k}}{2^{k}}\right) + \left(\sum_{i=0}^{k-1} 2^{i}\right)4$$

$$= n \times T(1) + \left(2^{k-1+1} - 1\right)4 = 3n + (n-1)4$$

$$= 3n + 4n - 4 = 7n - 4 = O(n)$$

18.1 Graphs

A graph G is made of a non-empty set V of vertices (nodes) together with a set *E* of edges

Each edge in S is an unordered pair $\{u, v\} \subseteq V$ with $u \neq v$

We write G = (V, E)

- Loops aren't allowed so $\{u, u\} = \{u\}$ is not a pair
- Parallel edges $\{\{u,v\}, \{u,v\}\} = \{\{u,v\}\}$ aren't allowed
- Graphs with no loops and parallel edges are simple

Terminology

- Adjacent: u is adjacent to v if $\{u, v\}$ is an edge
- **Incident:** An edge *e* is incident to *u* if one of the two endpoints of *e* is *u*
- **Degree:** The degree of a vertex $v \in V$ is the number of edges incident to v

Theorems

- ► Handshaking Lemma: $\sum_{v \in V} \deg(v) = 2|E|$
- *G* has even number of vertices with an odd degree

18.2 Paths

A path is a sequence of distinct vertices $v_0, ..., v_l$ such that $\{v_i, v_{i+1}\} \in E \text{ for } 0 \le i < l$

It can be described as l-1 edges $\{v_0, v_1\}, \dots, \{v_{l-1}, v_l\}$ The vertices v_0 and v_l are the endpoints of the path and l it its length

If \exists a path with endpoints $v, w \in V$, then v and w are connected

If all vertex-pairs are connected, then the graph is connected

20.1 Cycles

A cycle is a sequence of vertices $v_0, v_1, ..., v_{l-1}, v_0$ s.t:

- $v_0, v_1, ..., v_{l-1}$ is a path
- $\{v_0, v_1\}, \{v_1, v_2\}, \dots, \{v_{l-1}, v_0\}$ are distinct edges The length of this cycle is l

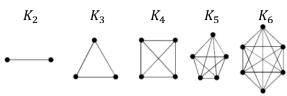

Note: Cycles of length 0, 1 or 2 are not allowed

20.2 Walks

- A walk is a path where we allow repeated vertices
- A closed walk is a cycle where we allow repeated vertices

20.2 Families of Graphs

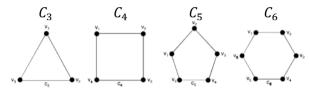

20.2.1 Complete Graphs K_n for $n \ge 1$

Every pair of vertices is connected by a unique edge Each vertex is connected to n-1 other vertices

Number of edges: $|E| = \frac{n(n-1)}{2} = O(n^2)$

20.2.2 Cycles C_n for $n \ge 3$

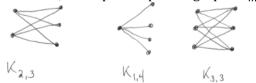

The whole graph is a single cycle with n vertices, the graph makes a closed chain

20.2.3 $(m \times n)$ -grids for $n \ge m \ge 1$

22 Usual Family of Bipartite Graphs K_{mn}

For $n \ge m \ge 1$, a complete bipartite graphs $K_{m,n}$

20.3 Subgraphs

H = (V', E'), where $V' \subseteq V$ and $E' \subseteq E$, then $H \subseteq G$

20.4 Connected Components

A connected component is a subgraph consisting of:

- All vertices that are connected to a given vertex
- Together with all edges incident to them

20.4 Forests, Trees and Leaves

- Forest: A forest is a graph that has no cycle
- Tree: A tree is a connected forest
- Leaf: A leaf in a forest is a vertex of degree 1

+ Theorems

- For n = |V|, m = |E|. If G is a forest, then n > m and G has n m connected components
- For a tree G, n = |V| = |E| + 1 = m + 1

20.5 Spanning Trees

A spanning tree of a connected graph G is a subgraph of G that includes all vertices of G that is a tree Every connected graph has a spanning tree

21.1 Partitions

Two sets *S*, *T* partition a set *E* if:

- $S \neq \emptyset$, $S \cup T = E$
- $T \neq \emptyset$, $S \cap T = \emptyset$

21.2 Bipartite Graphs

A graph is bipartite if V can be partitioned into A and B s.t each edge has one endpoint in A and one in B

+ Theorems

• For a bipartite graph with partition (A, B):

$$\sum_{v \in A} \deg(v) = \sum_{v \in B} \deg(v)$$

- ▶ If a graph *G* has a closed walk of odd length, then *G* has a cycle of odd length
- ▶ A graph is bipartite ↔ No odd-length cycles

23 Matching

- A matching is a graph with a subset $M \subseteq E$ where no pair of edges share a vertex
- A matching is <u>maximum</u> if it contains the greatest number of edges possible
- A matching is <u>perfect</u> if it matches all vertices

+ Theorems

- If a graph has an odd number of vertices, it cannot have a perfect matching
- If the set of edges is the union of two matchings s.t one isn't empty, then *G* is bipartite

23 Neighbour Set

Let G = (V, E) be a graph and let $S \subseteq V$ The neighbour set of S (denoted N(S)) is the set of vertices having at least one neighbour in S $N(S) = \{v \in V \mid \{v, s\} \text{ is an edge for some } s \in S\}$

Theorems (Hall's Theorem)

For G, a bipartite graph with partition (A, B): \exists a matching that matches all vertices in AFor every subset $S \subseteq A$ we have $|N(S)| \ge |S|$

12 RSA

12.1 Key Generation

- \triangleright *p*, *q*: Two prime numbers
- n = pq, n is the modulo used. It's part of the public key
- $\lambda(n) = \operatorname{lcm}(p-1, q-1) = \frac{|(p-1)(q-1)|}{\gcd(p-1, q-1)}, \text{ is kept a secret}$
- e, an integer such that $2 < e < \lambda(n)$ and $GCD(e, \lambda(n)) = 1$. It's part of the public key
- ▶ d: The private key. It's defined as $de \equiv 1 \pmod{\lambda(n)}$, the multiplicative inverse of $e \mod \lambda(n)$ Another formula for d: de - k(p-1)(q-1) = 1

12.2 Key Distribution

If Bob wants to send a text to Alice:

- Bob needs to know Alice's public key to encrypt the message
- Alice uses her private key to decrypt it

So Alice sends Bob her public key (n, e)

12.3 Encryption

Given the public key (n, e), we can encrypt the message MWe first turn the plaintext M into integers $m_1, ..., m_k$ such that $0 \le m < n$

Then we compute the ciphertext of each m using the public key (n, e): $c \equiv m^e \pmod{n}$ for each $m_1, ..., m_k$

Then we send the ciphertext values *c* to Alice

12.1 Decryption

Alice can decrypt the message c using the private key d: $c^d \equiv m \pmod{n}$

Alice can then regroup all the integers m into the original message M
